F50V PAGING FUNCTION

Popular older paging systems operate on 25KHz. As you know those will not be legal to operate once the new FCC regulations that go into effect January 1, 2013.

The same familiar tone in pagers using that system is now available in the F50V/60V radios. New F50V firmware allows the dealer to program the popular Fire/EMS paging function. Now users have a radio and paging function in one, so they won't have to get used to something new.

Listen to it to see what it sounds like:

(The sound is quite loud on the radio, so turn your volume up)

This new firmware (V3.6.1) is on the Knowledge Base ready for download. To easily find the article type in C37E554141 to the article search function. The new feature is not in current radios in stock, so you will have to load the new firmware yourself.

Note: The current CSF50V software will NOT program the paging function. You must download the CS-F50V version 3.1.1.
